

ABSTRACT OF THE TECHNICAL CONTENTS OF THE INVENTION

The invention relates to a process for the preparation of crystalline forms of the optical enantiomers of modafinil, comprising stages comprising :

- i) dissolving one of the optical enantiomers of modafinil in a solvent other than ethanol,
- ii) crystallising the modafinil enantiomer,
- iii) recovering the crystalline form of the modafinil enantiomer so obtained.

The invention also relates to a process for the preparation of the optical enantiomers of modafinil.
